Exam #1 Study Guide: EETS7304-401-1247

From EETS7304-401-1247 <notifications@instructure.com>

Date Sun 10/6/2024 8:10 AM

To Rogers, Darrell <dlrogers@mail.smu.edu>

The test will be multiple choice, and will consist of a total of 40 questions all equally weighted (2.5 pts each). All of the questions will come from modules 1-3 which I have covered up until last week, as well as basic questions on Wireshark based on the 1st two lab assignments. Below is a breakdown of what topics you should focus your studies on. I have opened the exam and it can be taken via lockdown browser over the next 10 days.

Module 1: Introduction, Wireshark, NADH, SONET and Wireshark +assignments (10 Questions)

Roles of working groups and standards organizations

OSI 7-Layer Model - what protocols, devices or addressing belongs to what layer

SONET - Layers, finding data rates, frame duration and size.

Wireshark - basic uses, menus and capabilities, questions based on lab assignments 1-2. Knowledge about how and where to capture and what to expect to see.

=====

Module 2: Ethernet, STP, WLAN, ARP (10 Questions)

Ethernet - IEEE 802 standards, speed/media, MAC addresses, CSMA/CD, identifying collision/broadcast domains based on topologies, their impact on performance, how VLANs impact number of domains and performance.

STP role in layer 2 networks.

WLAN standard standards - most common variations

ARP - basic characteristics and definition

=====

Module 2: WAN, Frame Relay, ATM and MPLS (10 questions)

Frame Relay - Knowledge of terms - DLCI, FECN/BECN, DE, PVC, CIR and their applications on frame relay networks

ATM - Characteristics, Terms (UNI, NNI, CBR, ABR, UBR), cell makeup, overhead,

MPLS - understand the basic roles of the different devices included in an MPLS network, how label switched paths work.

=====

Module 3: IP Subnetting/ICMP (10 Questions)

Recognizing classful networks and default masks

Understanding of Variable Length Subnet Mask (VLSM), CIDR notation

Sizing networks using single mask or variable length masks

How many networks or hosts given a subnet and prefix

Given number of hosts determine size of subnet

How path MTU works

How applications like traceroute use ICMP.

=====
